In materials science, deformation refers to any changes in the shape or size of an object due to an applied force (the deformation energy in this case is transferred through work) or; a change in temperature (the deformation energy in this case is transferred through heat). The first case can be a result of tensile (pulling) forces, compressive (pushing) forces, shear, bending or torsion ...

1. Introduction. Hardness is one of the most characteristic properties of materials and often plays a key role in the progression of civilization because it has enabled progressively more sophisticated devices and machines to be constructed.

### General relationship between strength and hardness

A metal matrix composite (MMC) is composite material with at least two constituent parts, one being a metal necessarily, the other material may be a different metal or another material, such as a ceramic or organic compound. When at least three materials are present, it is called a hybrid composite. An MMC is complementary to a cermet

This paper reviews the current pathways for recycling of solid plastic waste, via both mechanical and chemical recycling. The predominant industrial technologies, design strategies and recycling examples of specific waste streams are reviewed.

ABSTRACT. Nanocomposites, a high performance material exhibit unusual property combinations and unique design possibilities. With an estimated annual growth rate of about 25% and fastest demand to be in engineering plastics and elastomers, their potential is so striking that they are useful in several areas ranging from packaging to biomedical applications.

Korrosion (från latinets *corrodere* som betyder *fräta sönder*) [1], frätning, innebär att ett material, vanligtvis en metall, löses upp genom en kemisk, oftast elektrokemisk, reaktion till en mer stabil form, som exempelvis oxider, hydroxider och sulfider. [2] Även andra material som metaller, som plaster eller keramer, kan korrodera. I dagligt tal syftar man dock vanligen till ...
